# Algorithms for Genome Rearrangement <br> Summer 2017 

## Exercises

## Exercise 06, 26.05.2017

1. Given the following two genomes:

$$
\begin{aligned}
& A=(\circ 11-12 \circ) \quad(\circ 23-4567 \circ) \quad(-9-1018) \\
& B=(1253-467) \quad(\circ 8-9-1011-12 \circ)
\end{aligned}
$$

(a) draw the genome graph of $A$ and $B$,
(b) draw the adjacency graph of $A$ and $B$.
(c) What is the DCJ distance between $A$ and $B$ ?
(d) Give an optimal DCJ sorting scenario from $A$ to $B$ and name the operations in your sorting scenario.
(e) If any of your intermediate genomes contains a circular intermediate chromosome, try to find an alternative optimal scenario that does not contain such a chromosome.
2. Given a genome A with $l$ linear chromosomes, and B with $k$ linear chromosomes, how many paths does the adjacency graph $A G(A, B)$ have?
3. How many different optimal DCJ sorting scenarios exist for the following two genomes?

$$
\begin{aligned}
& A=(\circ 1 \circ) \quad(\circ 4325 \circ) \\
& B=(\circ 12345 \circ)
\end{aligned}
$$
