

Seminar on Algorithms in Bioinformatics

You are making a document for the end of the semester, this will be an improved version of the article you were assigned to review, study and make a presentation of. You must make this document as your own by extending descriptions, adding examples or content from other research articles. If the article is focused on computer science, it might be good to include some biology in there. Make your own and better figures, unless the existing ones are super good.

Please use: `"\documentclass{article}"` on one or two columns, as you think it fits better your figures.

Please don't copy whole paragraphs from the original paper, try to make it as your own and don't forget to cite the authors.

This document must contain the following sections:

- Abstract.
- Introduction.
 - Motivations.
 - Background.
 - Previous or related approaches.
- Methods.
- Results.
- Discussion.
- References (Very important).

If you have any question, send me an email.
